                                                                                                                                                                                                    The present sequence represents a fusion protein, comprising E7 and E6 CC polypeptides from human papillomavirus type 16 (HPV16). The fusion CC protein is designated E7E6PentM, and comprises an E7 amino terminus CC (where residues 24, 26 and 91 have been replaced with glycine) and an E6 CC (arboxy terminus (where residues 63 and 106 have been replaced with CC glycine). E7E6PentM is representative of fusion proteins of the CC invention. The specification describes human papillomavirus E6 and E7 CC polypeptides, where the E7 polypeptide has mutations at any one or more CC of the amino acids corresponding to amino acids 24, 26 or 91 of the CC sequence given in AD044073 and the E6 polypeptide has no mutations or has CC mutations at any one or more of the amino acids corresponding to amino CC cacids 63 or 106 of there sequence given in AD044072. The polypeptides of CC the invention are useful for treating or preventing human papillomavirus CC (HPV)-associated cancers, such as cervical cancer. The fusion proteins CC and nucleic acids encoding the fusion proteins are useful for generating CC immune responses against HPV. They are also useful for treating lower CC gastrointesting liver cancers.

The second protein is taken from a group including human Lymphocyte Activation Gene (hLAG)-3. The first protein is a viral or bacterial antigen, a tumor antigen, parasitic antigen, or their mixtures. The viral antigens can be for hepatitis B (HBV), human papillomavirus (HBV), hepatitis C (HCV), human immunodeficiency virus (HIV), Epstein-Barr virus (EBV), Cytomegalovirus (CMV), and their combinations. The bacterial antigens can be intracellular bacteria of tuberculosis, leprosy and listeria. A vaccine of the invention has virucide, and antibacterial

These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonuclectide. The products of the invention can be used to induce arimmune response in a patient to an HPV antigen. They can also be used f preventing or treating HPV induced tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Composition comprising induce immune response

The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immunotherapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to human Papilloma virus (HPV) fusion proteins, linked to an immunological fusion partner that provides T helper epitopes to the HPV antigen. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyth protein (cLyth) or thioredoxin. The present sequence represents a mutated HPV-H. influenzae D protein, fusion protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a fusion protein, comprising E7 and E6 CC polypeptides from human papillomavirus type 16 (HPV16). The fusion CC protein is designated E7E6TEHM, and comprises an E7 amino terminus (where CC residues 24 and 26 have been replaced with glycine) and an E6 carboxy CC terminus (where residues 63 and 106 have been replaced with glycine). CC S7E6TEHM is representative of fusion proteins of the invention. The CC where the E7 polypeptide human papillomavirus E6 and E7 polypeptides, CC where the E7 polypeptide has mutations at any one or more of the amino CC acids corresponding to amino acids 24, 26 or 91 of the sequence given in CC ADO44073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids 24, 26 or 91 of the sequence given in ADO44072. The polypeptides of the invention are cuseful for treating or preventing human papillomavirus (HPV)-associated CC cancers, such as cervical cancer. The fusion proteins and nucleic acids CC cancers, such as cervical cancer and other cancer gastrointestinal CC tract cancers, e.g. anal cancer, and other cancers of the reproductive insolution are including and an anal cancer, and other cancers of the reproductive insolution are included and cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

The cell upon culture grows continuously and retains the identifying characteristics of the cell line designated ATCC-4047. Also described is a process of making a cell line. The insect cell line suseful in replicating baculoviruses, as a host substrate for baculovirus plaque assays, as a source of insect proteins, acts as depot for cell transfection to produce recombinant baculoviruses, and in expressing viral recombinant proteins.

Extracellular and intracellular viral recombinant proteins and virus-like particles expressed from the cell line are useful as pharmaceutical compositions, vaccines or diagnostic reagents. The present sequence represents a human papillomavirus type 16 (HPV-16) L2/E7/E2 fusion protein, which is used in the exemplification of the present invention.

The present invention describes a codon optimised polynucleotide encoding CC a viral capsid protein that self assembles into a virus-like particle CC (VLP) that exhibits conformational antigenic epitopes capable of raising CC neutralising antibodies, where the VLP is expressed from a host cell comprising the above codon optimised polynucleotide operably liked to a eukaryotic or prokaryotic control element, capable of replication in prokaryotic and/or CC eukaryotic host; (2) a host cell comprising the vector; (3) a cc multiplicity of VLPs that exhibit conformational antigenic epitopes, and CC papillomavirus related disease or disorder, comprising a CC multiplicity of VLPs that exhibit conformational antigenic epitopes, and CC acarrier, diluent or adjuvant; (4) a diagnostic kit for detecting a papillomavirus related disease or disorder, comprising a CC papillomavirus infection, comprising a multiplicity of VLPs that exhibit conformational antigenic epitopes, and cetection agent comprising a construction of the comprising a construction of the comprising a construction of the comprising a construction agent comprising a construction of the comprising a construction of construction of construction of construction of construction construction and construction construction of construction of construction and construction of constr

The present invention describes a method for purifying a recombinant extracellular or intracellular virus-like particle (VLP). The method comprises harvesting a cell suspension comprising cells containing a plurality of VLPs to produce a harvested supernatant, optionally the disrupting the harvested cells to produce cell lysates containing the VLP, clarifying the harvested supernatant, concentrating the containing the concentration, disfiltering the concentrated supernatant, and recovering the purified recombinant VLP. Also described: (1) a cell line designate
                                                                                                                                                                                                                                                                                                      Purifying a recombinant human papillomavirus (HPV) L1, useful for diagnosing, preventing or treating HPV infections, comprises clarifying, concentrating and diafiltering cells containing HPV particles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             purification; recombinant extracellular virus-like particle; Virecombinant intracellular virus-like particle; Virecombinant intracellular virus-like particle; virus-like particle; Virus-like particle; Virucide; vaccine; gene therapy, human papillomavirus; HPV; infection; dysplasia; HPV-16; fusion protein.

The VLPs have virucide activity, and can be used in vaccines and in gene therapy. The method is useful in isolating and purifying expressed viral gene products, including VLPs, in vitro. The gene products or particles may be used in detecting, preventing or treating HPV infections and associated symptoms like dysplasia. The present sequence represents an HPV-16 L2/B7/E2 fusion protein, which is given in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to chimeric virus-like particle comprising a recombinant viral capsid protein that encapsulates a recombinant viral protein during self assembly into a chimeric virus-like particle and exhibiting conformational antigenic epitopes capable of eliciting neutralising antibodies. The vaccine comprising the chimeric virus-like particles are useful for inducing immunity (humoral and/or cell-mediated immunity) against papillomavirus infection. The invention is also useful in gene therapy. The present sequence is HPV (human papillomavirus)-16 L2/E7/E2 fusion protein
The peptide is the sequence of the human papillomavirus HPV 16 E7 nucleoprotein. Peptides corresponding to regions (pref. epitopic regions) of HPV 16 E7 were synthesised by standard Merrifield synthesis. Examples of such peptides are E7 1-10, 29-50 or 70-81. Compositions contg. these

                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents Human papillomavirus (HPV), strain 16, E7 oncoprotein. The proliferative state of a cell transformed with HPV can be evaluated in the following manner. Cyclin/cyclin-dependent kinase complexes containing protein p21CIP1 (AAW46807-88) are isolated from the transformed cell, and the HPV E7 oncoprotein added to the isolated protein. Cyclin/cyclin-dependent kinase complexes are isolated from an untransformed cell that is substantially homogenic with the transformed cell, and the HPV E7 oncoprotein added. The kinase activities of the 2 samples are measured, where a proliferating transformed cell has a greater kinase activity that the untransformed cell. The method is used for determining the extent of interaction and/or inactivation between a cyclin/cyclin-dependent kinase inhibitor and the HPV E7 oncoprotein and thus evaluating the proliferative state of a transformed cell. (Updated thus evaluating the proliferative state of a transformed cell. (Updated the proliferative state of a transformed cell. (Updated the proliferative state of a transformed cell.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Evaluation of proliferative state of cells transformed with human papilloma virus - by determining cyclin-dependent kinase activity induced by E7 onco-protein.
                                                                                                                                                                                                                                                                                                                                                                                 Sequence 98

                                                                                                                                                                                                                                                  The invention relates to a novel assay for identifying compounds which inhibit viral replication and pathogenesis by increasing proteasomal degradation of viral components or molecules induced by viral infection. The method comprises reacting a compound with proteasomal protein (20% proteasomes separately with or without 19% and 11% complexes), viral gene product, and protein or peptide substrates, measuring protease activity; and identifying the compound as an inhibitor if the protease activity of the assay system is increased. The assays of the invention can be used to identify compounds which inhibit viral replication and pathogenesis, and modulate and/or regulate proteasome activity. Compounds which increase proteasomal degradation of viral components or molecules induced by viral infection are of value in the treatment of viral disease. Compounds which modulate proteasomal nuclease activity have use in the treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 13-JUN-1998;

However, the type and severity of disease caused by the papillomavirus is dependent on the strain causing the infection. The present sequence represents the human papillomavirus 16 E7 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a fusion protein comprising 2 amino acids sequences from 2 different papillomavirus specific (PVS) proteins. The fusion protein may be administered for preventing and treating papillomavirus infections in humans and animals. Papillomaviruses are implicated in the pathology of malignant tumour formation in the anogenital tract (of these tumours, cervical cancer is the most frequent (500000 cases/year) and in the formation of precursor lesions of cervical intrapithalial neoplasia ((IN)). Papillomaviruses also cause benign
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pusion proteins comprising papillomavirus specific proteins useful for vaccinating against malignant tumors of the anogenital tract such as cervical carcinomas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human papillomavirus; HPV; L1 fusion protein; vaccine; cytostatic; viral capsomere; virucide; dermatological; malignant tumour formation; cervical cancer; cervical intraepithelial neoplasia; genital wart;

                                                                                              S
                                                                                                                                                                                                                                        The present invention describes an isolated prepared human papillomavirus (HPV) epitope (I). (I) has antiviral activity, and can be used in vaccine (C production. Peptides and corresponding nucleic acid compositions from the C present invention are useful for stimulating an immune response to HPV by stimulating the production of CTL or HTL responses, specifically in the C manifested symptoms e.g. genital warts or neoplastic growth. The peptides (C manifested symptoms e.g. genital warts or neoplastic CTLs following (C can also be used in a tetramer staining assay to assess peripheral blood (C mononuclear cells for the presence of antigen-specific CTLs following (C exposure to a pathogen or immunogen, and as reagents to evaluate immune (C compositions are useful for removing warts or treating HPV infections. (C The epitopes for inclusion in an epitope-base vaccine may be selected (C from conserved regions of viral or tumour-associated antigens, which (C epitope-base vaccines. An additional advantage is the ability to combine (C epitopes achieving enhanced immunogenicity, the major benefit of the (C vaccine is that is safe and efficacious. AAB98391 to AAB98477 represent (C invention

cc cyroplasmic translocation domain of a Pseudomonas excretion (CC or a granulocyte-macrophage colony stimulating factor (GM-CSF); and (b) a CC second polypeptide domain containing an antigenic polypeptide. A CC composition comprising the chimeric polypeptide is useful for inducing an immune response such as a cytotoxic T cell response. The nucleic acid or cyrotoxic response to the composition is administered as naked DNA by gene gun or equivalent, or by liposomal CC composition. These are thus useful for vaccinating a mammal against composition by inducing an immune response to a pathogen. Preferably they care useful for vaccinating a mammal against the compositions and methods are useful for stimulating or enhancing the compositions and methods are useful for stimulating or enhancing the capid molecules and vaccination methods, yield potent antigen. The climeric nucleic capid molecules and vaccination methods, yield potent antigen-specific commune response that is at least 40 fold more potent than conventional CC DNA vaccines. The vaccines are safe and useful for administration to immunogenicity

                                                                            Creambent kinase-2 (CDK2) kinase (I) activity, comprising measuring (I) contivity on CDK2 substrate in the presence of human papillomavirus (HPV) CC E7 or its fragment, and in the presence of human papillomavirus (HPV) CC E7 or its fragment, and in the presence and absence of test compound. The clear compound is identified as inhibitor of E7-induced (I) activity when CC decreased phosphorylation of CDK2 substrate is detected. The method is useful for identifying an antivirate is detected. The method is cleantifying an inhibitor of E7-induced CDK2 kinase activity. This CC measuring viral proliferation in the presence and absence of identified inhibitor as an antiviral agent when CC decreased proliferation in the presence and absence of identified CC identified inhibitors are useful for reducing HPV E7-induced kinase activity or for ameliorating HPV proliferation by inhibiting E7-induced CC compared to viral proliferation in the absence of the inhibitor. The CC identified inhibitors are useful for reducing HPV E7-induced kinase complex. The inhibitors identified by inhibiting E7-induced CC prosence complex. The inhibitors identified by inhibiting E7-induced CC control of the inhibitors identified by inhibiting E7-induced cCC control of medicament for ameliorating viral infection e.g. HPV CC infection, adenoviral infection or similar virus 40 (SV40) infection. The CC correct os field.)

The method comprises measuring CDK2 kinase activity on a CDK2 substrate in presence of human papillomavirus (HPV) E7 (or fragment), in presence and absence of a test compound and measuring phosphorylation of substrate. The method is useful for identifying an inhibitor of E7-induced CDK2 kinase activity. The identified inhibitor is useful for reducing or inhibiting HPV proliferation in an individual. Inhibitors of E7 binding to the CDK2 complex are useful in preparing medicament for ameliorating viral infection e.g. HPV infection, adenoviral or SV40 infection. The present sequence represents a papillomavirus E7 fragment, which is used in the method of the invention. (Updated on 11-SEP-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a fusion protein comprising cell import and/or export signal sequences and an antigen which is suitable for immunizing an individual against a disease, together with a DNA that codes for said protein. The invention also relates to the use of the protein (II) and its encoding DNA (I) for immunizing an individual against diseases, in particular against infection-induced auto-immune and tumor diseases. This sequence represents a fragment of the human papillomavirus E7 protein used in the preparation of the fusion constructs described in the method

The nucleic acid is useful as a vaccine (DNA vaccine) for inducing enhanced antigen-specific immune responses, particularly those mediated by cytotoxic T lymphocytes. The nucleic acid and compositions comprising the nucleic acid is also useful for inhibiting the growth of tumours and cancers e.g. cervical cancer. This is the amino acid sequence of the human papillomavirus type 16 (HPV 16) early gene 7 (E7) used in the creation of a DNA vaccine
                                                                                                                    Human papillomavirus 16; HPV 16; cancer; squamous cell carcinoma; adenocarcinoma; koilocytosis; hyperkerotosis; intraepithelial neo; intraepithelial lesion; dysplasia; head cancer; neck cancer; small cell lung cancer; melanoma; oncogene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acids encoding a fusion polypeptide comprising an endoplasmic reticulum chaperone polypeptide linked to an antigenic polypeptide, useful as a vaccine for inducing antigen-specific immune responses.

                                                                          뭐
                                                                                                                Ś
                                                                                                                                                                                                                                      CC soluble in aqueous solution and has a lysine or cysteine residue near the comming the proposal proposal proposal proposal process and formany glycine and asparagine residues. The peptides and diagnostic comethod are used to diagnose HPV infection, especially infection since HPV 16 cc oncogenic HPV by using peptides derived from the E2 region, since HPV 16 cc and 18 are the main HPV genetic types associated with cancers, and cy resence of antibodies to E2 protein is known to provide evidence of HPV 16 cc infection. They are also useful to diagnose HPV associated malignancy or premalignancy, especially carcinoma by using peptides derived from the E6 co r E7 regions, since E6 and E7 are thought to be tumour-specific cor antigens. The peptides and diagnostic method are especially useful to diagnose cervical carcinoma (e.g. adenocarcinoma of the uterine cervix) cc diagnose cervical carcinoma (e.g. adenocarcinoma of the uterine cervix) cc diagnose cervical carcinoma (e.g. adenocarcinoma of the uterine cervix) cc diagnose of malignant cancers. They are also used to detect head and neck cancers, small cell lung cancers, penal and anal squamous cell carcinomas cc and melanoma. This is the amino acid sequence of the E7 early coding cregion of HPV 16, an oncoprotein that destabilies cell cycle control cc through its interaction with the cyclin-dependent kinase inhibitor corotein, p21, described in the method of the invention.                                                                                                                                                                                                                                                                                  밁
                                                                                                                                                                                                                                                                                                              S
                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a nucleic acid molecule that encodes a fusion CC polypeptide, comprising a first nucleic acid sequence encoding a CC polypeptide, optionally, fused in frame with the nucleic acid, a linker nucleic acid encoding a linker peptide, and a nucleic acid, a linker CC nucleic acid encoding a linker peptide, and a nucleic acid that is linked in frame to them, and that encodes an antigenic peptide or polypeptide. CC The nucleic acid molecule, polypeptides and vectors are useful as CC vaccines for enhancing immune responses, primarily cycotoxic T CC lymphocytes (CTL) responses to specific antigens such as tumour or viral CC antigens, and for inhibiting growth or preventing re-growth of a tumour. CC The packaging cell line is useful for generating alphavirus replicon CC particles without contamination from replicon-competent virus. The pathogenic organisms include viruses such as human papilloma virus (HPV), hepatitis B virus, hepatitis C virus, human immunodeficiency virus, the patitis B virus, and bacteria that grow intracellularly such as mycobacteria CC and listeria. The present sequence represents a wild-type HPV E-7 protein
                                                                                                                                                                                                                                                                                                                                                                  Query Match

A complex of the invention has virucide and cytostatic activity, and may have a use as a vaccine. The complex is useful for identifying agents for treating or preventing a conditions involving altered level of the complex, e.g. human papilloma virus (HPV) infection, or cancer. The compositions, antibodies, vectors and methods are useful for treating such diseases. The sequences shown in ADF09500-ADF09583 represent proteins of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New purified complex comprising a first polypeptide and a second polypeptide, useful for identifying agents for treating/preventing a condition involving altered level of the complex e.g. human papilloma virus infection, or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 N-PSDB;
                                                                                                                     Identifying a compound that inhibits E7 cellular proliferation activity by administering a compound to a system, where the system maintains Akt activity and selecting a compound that decreases the amount of Akt

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC The present sequence is the protein sequence of human papillomavirus E7 CC oncoprotein. E7 promotes oncogenesis through an inhibition of p22Cip21 CC transport into the nucleus. E7 abrogates Raf-associated arrest and CC prevents inhibition of cyclin E-CDK2 activity without disrupting Raf CC induction of p21Cip21. E7 neither interacts with p21Cip1 nor derepresses CC p21Cip1-associated CDK2 activity, but instead reduces the association CC permen p21Cip1 and cyclin E-CDK2 complexes. Raf down-regulates steady-cc state levels of Akt, a regulator of p21Cip1 localisation, leading to loss of p21Cip1 phosphorylation and accumulation of p21Cip1. E7 disrupts the CC effects of Raf on Akt activity and prevents p21Cip1 nuclear accumulation. CC Maintenance of Akt activity is necessary and sufficient to bypass Raf CC arrest. The invention provides methods for identifying and using compounds capable of promoting the nuclear activity and p21Cip1. The methods can be used to inhibit aberrant cellular proliferation for contents.

                             The present invention relates to a method for generating an immune response to an antigen in a patient. The method comprises administering to the patient an immunoglobulin (Ig) or its portion where the Ig has at least one peptide epitope of the antigen attached to the Ig or its portion and administering the immunoglobulin or its portion in

                                                                                                                                                                  The specification describes a method for constructing a synthetic polynucleotide from which a polypeptide is producible at a different level in a Chinese Hamster Ovary (CHO) cell compared to when using a parent polynucleotide encoding the same polypeptide. The method comprises selecting a first codon of the parent polynucleotide for replacement with a synonymous codon, where the synonymous codon is selected on the basis that it exhibits a different translational efficiency in the CHO cell than the first codon in a comparison of translational efficiencies of codons in test CHO cells. The method is useful for constructing synthetic polynucleotides which are translated more efficiently, compared to the parent polynucleotide. The present sequence represents Human papillomavirus type 16 (HPV16) E7 protein. The E7 polynucleotide was codon-modified, to demonstrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Constructing a synthetic polynucleotide, useful for producing a polypeptide at a higher level in a Chinese Hamster Ovary cell, compriselecting a first codon of the parent polynucleotide for replacement
                                                                                                              Sequence 98
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    a synonymous codon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 2004-270043/25.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              13-SEP-2002; 2002US-0410410P

                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a wild type E7 protein from human papillomavirus type 16 (HPVI6), which is used to produce fusion proteins of the invention. The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV) -associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New polypeptide comprising human papillomavirus E6 and useful for treating or preventing human papillomavirus cancers, e.g. cervical cancer.

The invention also relates to vaccine formulations comprising viral capsomeres and methods for their production. The fusion protein is useful for treating or preventing a papilloma virus infection in an animal, particularly humans and is also useful in the production of vaccines. The present sequence is human papilloma virus (HPV) strain HPV16 E7 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New fusion proteins comprising an amino acid sequence from a first and a second papilloma-virus specific protein, useful in vaccines for treating or preventing a papilloma virus infection in an animal, particularly

The invention comprises a nucleic acid molecule (DNA vaccine) that encodes a fusion polypeptide which is useful as a vaccine composition. The nucleic acid of the invention contains: a first nucleic acid encoding a polypeptide that promotes processing via the MHC class I pathway; a second sequence encoding a signal peptide; and a third sequence encoding a natigenic polypeptide. The DNA vaccine of the invention is useful for inducing or enhancing an antigen specific immune response, or to inhibit growth or prevent re-growth of a tumor expressing Human papillomavirus (HPV) E7 or E6 protein. The present amino acid sequence represents a processing that the present amino acid sequence represents a process to the present amino acid sequence represents a process that the present amino acid sequence represents a process that the present amino acid sequence represents a process that the present amino acid sequence represents a process that the present amino acid sequence represents a process that the present amino acid sequence represents a process that the present amino acid sequence represents a process that the present amino acid sequence represents a process that the present amino acid sequence represents a process that the present amino acid sequence represents a process that the present amino acid sequence presents and the present amino acid sequence presents are present amino acid sequence present amino acid sequence presents and the present amino acid sequence present amino acid 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid molecules encoding a fusion polypeptide comprising an antigen, a signal peptide, and a heat shock protein, useful as a vaccine for inducing or enhancing immune response or for inhibiting or preventing tumor growth.
                                                                                                                                                                                                                                                    Human papillomavirus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a method of ameliorating human papillor virus (HPV) proliferation. The method involves administring an inhibit of E7-induced cyclin-dependent kinases (CDK2) phosphorylation or an inhibitor of E7-binding CDK2 kinase complex that reduces HPV E7-induced CDK2 kinase activity. The present sequence is the human papillomavirus I
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cytostatic; immunohistol
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ameliorating human papillomavirus proliferation involves administering inhibitor of E7-induced cyclin-dependent kinases 2 phosphorylation or inhibitor of E7-binding cyclin-dependent kinases 2 kinase complex that reduces kinase activity.
New combination of antibodies comprises an anti-HPV-16 E7 antibody and anti-HPV-18 E7 antibody, useful for preparing a diagnostic composition
                                                                                                                                                                                                                                                                                                                                                                                                               WO2005026731-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          anogenital;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 HPV 16

CC fragment in a goat, and affinity-purifying antibodies as obtained in the CC eliciting step, and an anti-HPV-18 E7 antibody. The combination of CC antibodies is useful for the preparation of a diagnostic composition for CC (immuno-) histological detection is darried out on Pap-smears, cervical CC (carcinoma) biopsies, anogenital biopsies, mamma biopsies, bead- or neck CC biopsies, or prostate biopsies. The diagnostic composition is used for CC cancer, for measuring the status of an existing sexually transmitted disease or cancer, or for screening therapy efficiency in the treatment CC disease or cancer, or for screening therapy efficiency in the treatment CC disease is a high risk HPV infection or where the cancer is cervical CC cancer, breast cancer/mamma cancer, prostate cancer/neoplasia (AIN). The CC cancer, breast cancer, and/or anogenital cancer/neoplasia (AIN). The CC combination of antibodies or the diagnostic composition are useful in an CC in vitro method for the detection of high risk HPV-31, HPV-33, HPV-35, HPV-39, HPV-45, HPV-52, HPV-58, and/or HPV-59, HPV-58, and/or HPV-59, HPV-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antibody raised against this protein may be used in a combination cantibodies which comprises an anti-HPV-16 E7 antibody obtainable by eliciting an in vivo humoral response against HPV-16 E7 protein or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC acid vector comprising a first sequence encoding an antigenic polypeptide cor peptide, and optionally, a second sequence linked to the first compensation of the much period cor peptide, and optionally, a second sequence linked to the first compensation mucleic acid vector encoding an anti-spotcotic polypeptide. CC and a second nucleic acid vector encoding an anti-spotcotic polypeptide. CC when the second vector is administered with the first vector to a compensation of the second vector is administered with the first vector to a compensation of the invention than composition for the invention than composition for the response to the antigenic polypeptide. The invention further includes a particle comprising a material that is suitable for introduction into a cell or an animal by particle composition; a pharmaceutical composition capable of inducing or composition; a pharmaceutical composition capable of inducing or composition; a pharmaceutical composition capable of inducing or capable of inducing or enhancing an antigen specific composition antigen specific composition in a subject; increasing the numbers of CDB+ CTLs and inducing the growth of a tumor in a subject; The nucleic acid composition is useful as compositic acitivity. This sequence represents ananti-apoptotic vector HPV composition of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                        ई
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a new polynucleotide comprising a multi-epitope CC construct comprising nucleic acids encoding the human papillomavirus CC (HPV) cytotoxic T lymphocyte (CTL) epitopes e.g., HPV16.E1.214, and that CC are directly or indirectly joined to one another in the same reading CC frame, a vaccine minigene. Also included are a vector comprising the CC multi-epitope construct, a polypeptide comprising an amino acid sequence encoded by the polynucleotide, a composition (comprising the CC polynucleotide, vector and/or polypeptide and a carrier), a cell CC (comprising the polynucleotide, vector or polypeptide), inducing an CC immune response against human papillomavirus virus (HPV) and making the polynucleotide, vector or polypeptide. The epitopes are derived from CC epitopes may be linked via a GP-anchor/spacer peptide. The order of the cepitopes in the vaccine protein are disclosed in the tables referred to comprising the useful in preparing a composition for inducing an immune CC in the claims of the specification. The polynucleotide, vector or polypeptide is useful in preparing a composition for inducing an immune CC defense against human papillomavirus virus (HPV) and thus providing a defense against human papillomavirus virus (HPV) and thus providing a composition in an HPV protein used to derive epitopes for the vaccine of the
                                                                                                                                                                                                                                                                                문
                                                                                                                                                                                                                                                                                                                                                                                                             Matches

                                                                                                                                                                                                                                                                                       CC construct comprising nucleic acids encoding the human papillomavirus (HPV) cytotoxic Tlymphocyte (CTL) epitopes e.g., HPV16.E1.214, and that CC are directly or indirectly joined to one another in the same reading CC frame, a vaccine minigane. Also included are a vector comprising the CC multi-epitope construct, a polypeptide comprising an amino acid sequence CC encoded by the polymucleotide, a composition (comprising the polymucleotide, vector and/or polypeptide and a carrier), a cell CC (comprising the polymucleotide, vector or polypeptide), inducing an CC immune response against human papillomavirus virus (HPV) and making the CC polymucleotide, vector or polypeptide. The epitopes are derived from CC different strains of HPV and are from the El, E2, E6 and E7 proteins. The CC epitopes may be linked via a GP-anchor/spacer peptide. The order of the CC epitopes in the vaccine protein are disclosed in the tables referred to CC in the claims of the specification. The polymucleotide, vector or composition for inducing an immune CC response against human papillomavirus virus (HPV) and thus providing a CC defense against human papillomavirus virus (HPV) and thus providing a CC defense against human papillomavirus virus (HPV) and thus providing a CC defense against human papillomavirus virus (HPV) and thus providing a consense of the consens

                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel vaccine composed of an antigen protein and a second protein as an s-(methyl mercury)-1-cysteine (CMH class II) ligand. The second protein is taken from a group including human Lymphocyte Activation Gene (hLAG)-3. The first protein is a viral or bacterial antigen, a tumor antigen, parasitic antigen, or their mixtures. The viral antigens can be for hepatitis B (HBV), human papillomavirus (HPV), hepatitis C (HCV), human immunodeficiency virus (HIV), Epstein-Barr virus (BBV), cytomegalovirus (CMV), and their combinations. The bacterial antigens can be intracellular bacteria of tuberculosis, leprosy and listeria. A vaccine of the invention has virucide, and antibacterial activity. The present sequence represents the HPV16 wild-type E7 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Therapeutic vaccine, for viral and bacterial conditions, comprises antigen protein and a viral or bacterial protein, coupled together stable hydrogen or covalence bonds in biological media.

                                                                                                                                                                             Gene expression; therapeutic; immune acquired immune deficiency syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to fusion protein comprising papilloma virus-specific (PVS) protein and their encoding polynucleotides. The invention is useful in preparing a composition for treating and preventing papilloma virus infection in humans. The present sequence the Human papillomavirus type 16 E7 protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    the same protein or polypeptide as a wild-type polynucleotide. The invention also relates to a method for enhancing expression of a gene, a method of preventing or treating a disease in a mammal, a composition comprising a modified polynucleotide describe above and a pharmaceutical vector. The method additionally comprises adding an immunoglobulin leader sequence, such as an IgE leader sequence, to the modified polynucleotide. The composition is useful for preparing a medicament for inducing an immune response in a mammal or for treating an infection or condition, e.g. HIV or AIDS in a mammal. The polynucleotide and methods are useful for enhancing gene expression. This sequence represents the HPV16 E7 protein used in the scope of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Preparing a polynucleotide, useful for enhancing comprises assembling oligonucleotides comprising a modified polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method of preparing a polynucleotide that provides enhanced expression of a gene, comprising assembling oligonucleotides comprising surrogate codons to form a modified

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention involves hybrid proteins consisting of amino acid sequences of oncoprotein E7 of human papilloma virus of 16 and 18 types that are bound covalently with amino acid sequence of heat shock protein with molecular mass 70 kDa (Hsp70) from M. tuberculosis - E716-Hsp70 and E718-Hsp70, respectively. The invention relates to composition of recombinant proteins, method for preparing the composition, pharmaceutical kit of reagents used in immunotherapy and prophylactic vaccination of tumour diseases in anal-genital region and methods for immunotherapy and prophylactic vaccination. The fusion proteins are used in immunotherapy and prophylactic vaccination of tumour diseases in anal-genital sphere. The present sequence is the HPV16 E7 protein.
The new invention relates to methods and compositions that allow production of antigen specific antibodies to antigens that have traditionally been unable to elicit an adequate and specific immune response. The method comprises producing monoclonal antibodies specito an antigen of low immunogenicity by chemically conjugating the ar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antibody; monoclonal antibody; antibody production; hybridoma; screening; E7 oncoprotein; immuno-diagnosis; diagnosit; immunoconjugate; immunoassay; radioimmunoassay; enzyme-linked immunosorbent assay; transmissible spongiform encephalopathy; cerebroprotective; cervical intraepithelial neoplasia; cytostatic; immunoglobulin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 99 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC and a nucleotide sequence encoding HSP70 and transfecting a host cell control with the plasmid. The nucleotide sequence encoding E7 oncoprotein CC comprises ADY92614. The nucleotide sequence encoding HSP70 CC comprises ADY92618. Alternatively, the conjugating is performed CC chemically using glucaraldehyde. Screening for specificity is done by CC various assays such as radioimmunoassay, enzyme-linked immunosorbent CC assay, or sandwich immunoassay. The antibodies are useful for determining CC if a subject is at risk of developing spongiform encephalopathy CC comprising an antibody that specifically detects Prion protein. The Prion CC protein peptide comprises ADY92619, ADY92620 or ADY92622. Antibodies specific to E7 oncoprotein are useful for detecting cervical cells and screening the specimen for the presence of E7 oncoprotein. The monoclonal antibodies comprise at least two immunoglobulin isotype is IgG2a or IgG2b. The immunoglobulin isotype has specificity for a different antigenic determinant than the second immunoglobulin isotype. The present sequence HPV16 E7 oncoprotein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              to a carrier molecule, immunizing an animal with the conjugated antigen, harvesting B cells from the animal, creating a hybridoma from the harvested B cells, and screening the hybridoma for specificity to the native antigen. The antigens can be B7 oncoprotein, Prion protein peptide, hyaluronic acid or matrix metalloprotease 3. The carrier molecule is HSP70. The chemical conjugation comprises creating a plasmid with a nucleotide sequence encoding the antigen, such as B7 oncoprotein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a HPV16 E7 protein. HPV16 E7 was fused to a heat shock protein (Hsp), and used used in the method of the invention. The specification describes a method of determining whether a compound stimulates a Th.-like response. Thi cells are a subset of CD4+ T lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fusion protein comprising at least a fragment of Hsp, and then detecting the TH1-like response exhibited by the cell sample. The proteins which may be used in the method of the invention are Hsp65, Hsp40, Hsp10, Hsp60, and Hsp71. The method may be used to identify compounds that stimulate Th1-like responses in response to microbial
                                                                                                                                                                                 Screening for compounds that stimulate Th1-like responses in CD4+lymphocyte cells.

Th1 cells are a subset of CD4+ T lymphocyte cells. The method comprises contacting naive lymphocytes in vitro with a fusion protein comprising at least a fragment of Hsp, and then detecting the TH1-like response exhibited by the cell sample. The proteins which may be used in the method of the invention are Hsp65, Hsp40, Hsp10, Hsp60, and Hsp71. The method may be used to identify compounds that stimulate Th1-like responses in response to microbial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cytostalic; respiratory-Gen, antiasthmatic; vaccine; immunomodulator; immune response; atopic disease; altergy; seasonal respiratory allergy; perennial respiratory allergy; allergic rhinitis, hayfever; nonallergic rhinitis; vasomotor rhinitis; irritant rhinitis; grass pollen allergy; weed pollen; tree pollen; animal danders; allergic asthma; food allergy; house dust mite allergy; fungal spore; cancer; tumour progression; T cell lymphoma; melanoma; lung cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Flammulina velutipes.
Human papillomavirus.
   This invention relates to a novel Fve (Flammulina velutipes) polypeptide comprising at least one biological activity of native Fve protein, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 28-OCT-2004.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WO2004092210-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Fve polypeptide; antiallergic; antiinflammatory; antiasthmatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel Fve fusion protein mutant sequence #48.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ADT75831;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ADT75831 standard;

Best Local :
This sequence represents a chimeric E6 or E7 protein or E6/E7 fusion protein from Human papillomavirus (HPV) linked to an immunological fusion partner, in this case, a fragment of the Haemophilus influenzae B protein D. The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immunotherapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAX78791-X78801 represent nucleic acid sequences which encode novel constructs comprising an E6 or E7 protein or E6/E7 fusion protein from HPV (represented in AAX25375-X25386). These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce ar immune response in a patient to an HPV antigen. They can also be used i preventing or treating HPV induced tumours
                                                                                                                                                                                                                                                Disclosure; Fig 1; 95pp; English.
